

# Self-evaluation report

Pavel Abrosimov

s0946889

The contribution from my side was mainly related to system design and implementation. I was proposing the design solutions, refining ideas with my team, helping on selection of vision components, creating a GUI controlling application for the system and creating an interfacing part for robot communication module.

I was contributing to system design to reach good final results by:

- creating a top level application that schedules the workload for other components
- deciding on interconnection between components (as well as programming languages for components)
- creating interfacing component for robot communication module

The team is very friendly, hard working and enthusiastic. From my point of view there are no obvious areas for improvement.

I was contributing well for the achievement of first milestone and believe so did everyone else. On this basis I believe I gain 3-4 points.

Understanding the importance of each component, I was also helping the team members whose responsibility is vision component by looking at the previous year teams solutions and selecting the projects worth reusing. I also looked at OpenCV library and made a research on how the vision system could be improved.
